TITLE: Hardness of tungsten in prolonged tests

SOURCE: Poroshkovaya metallurgiya, no. 5, 1964, 47-48

TOPIC T A C S: tungsten, tungsten hardness, tungsten hot hardness

ABSTRACT: Specimens of strain-hardened and annealed VRN-type tungsten were subjected to hardness tests at 20, 940, and 1310°C under a static load applied for periods of from 10 sec to 1 hr. The maximum drop in hardness, i.e., the highest rate of deformation, was found to occur in the first 20--30 sec (see Fig. 1 of the Enclosure). In logarithmic coordinates, the time dependence of hardness is linear and follows the dependence established by V. P. Shishokin. Orig. art. has: 5 figures.

TITLE: Accuracy in determining hardness at elevated temperatures

SOURCE: Poroshkovaya metallurgiya, no. 6, 1964, 79-82

TOPIC TAGS: hardness, high temperature measurement, hardness determination, tungsten molybdenum

ABSTRACT: Using tungsten and molybdenum as examples, the author analyzes the accuracy of determining hardness at high temperatures mathematically, hardness being taken as a function of load applied, diameter of indentation, loading time, and the absolute temperature of the test. The test temperatures were 940, 1600, 2500, 2500, and 3000°C. From the experimental data, the limiting relative errors of determining hardness were calculated. The calculations showed that these errors were reasonably small at high temperatures and that the errors were mostly affected by the error in measuring the temperature itself (2500-3000°C). The accuracy in determining hardness markedly increased with an increased accuracy of measuring the temperature; e.g., if the accuracy in measuring the temperature of 3000°C was

Canj 3/2

L 23302-65

ACCESSION NR: AP5001594

increased by 6.5%, the limiting relative error in determining the hardness of tungsten at this temperature was decreased by 3%. Orig. art. has: 1 table and 10 formulas.

ABSTRACT: An experimental testing chamber for testing the mechanical properties of high-melting metals in a vacuum and in an inert medium at high temperatures has been developed (see Fig. 1). The temperature dependence of the modulus of elasticity, strength limit, and hardness limit of tungsten and molybdenum were determined. The experimental results are presented graphically (see Fig. 2). It was found that the strength and hardness limit obeyed the expressions of Frantsevich-Vrontskiy and

TITLE: On the relationship between strength and hardness in tungsten and molybdenum over a wide temperature range

SOURCE: Poroshkovaya metallurgiya, no. 2, 1965, 57-59

TOPIC TAGS: molybdenum, tungsten, metal hardness, yield strength, tensile strength, temperature dependence

ABSTRACT: The temperature curves for hardness and tensile strength in tungsten and molybdenum conform to an exponential law, and when they are plotted in semilogarithmic coordinates ($\ln H - T$ and $\ln \sigma_B - T$), they show three linear sections with characteristic high temperature and low temperature breaks. The relationship between hardness and tensile strength is given as:

$$\frac{\sigma_B}{H} = \frac{m_n \sigma_0 e^{(\alpha_n - \beta_n)T}}{k_n H_0}$$

where H_0 and σ_0 are the hardness and tensile strength at 0°K; α_n ($\alpha_1, \alpha_2, \alpha_3$) and β_n ($\beta_1, \beta_2, \beta_3$) are the temperature coefficients for the hardness and tensile strength

Card 1/2

L 33514-65
ACCESSION NR: AP5006192

in the respective sections; $k_n(k_1, k_2, k_3)$ and $m_n(m_1, m_2, m_3)$ are the constants for the respective sections. Grade VRN tungsten and grade MRN molybdenum were used as research materials. Curves are plotted for the relationships between hardness, tensile strength and yield of the metals in the cold-hardened state. The experimental data confirm the exponential behavior of the theoretical curves. Orig. art. has: 4 figures, 6 formulas.

TITLE: The Effect of the Grain Size on Magnetic Properties of Cold Rolled Transformer Steel

PERIODICAL: Tekhn.-ekon. byul. Sovnarkhoz Zaporozhsk. ekon. adm. r-na, 1958, Nr 7, pp 45 - 49

ABSTRACT: Investigations were carried out into the effect of the grain size on specific loss and magnetic induction of cold rolled textured transformer steel. It was stated that high magnetic properties of the steel could only be obtained by a homogenous coarse-grained structure. Decreased specific loss and higher magnetic induction occurred with an increase in the grain size up to 80 - 100 mm. Fine grained structure reduced magnetic induction by 10 - 20% and increased specific loss by 20-50%. Finegrained metal contained a higher amount of non-metallic impurities and O₂.

TITLE: A Decrease in the Thickness of Coating During Hot Tinning
of Black Sheets (Umen'sheniye tolshchiny pokrytiya
pri goryachem luzhenii zhesti)

PERIODICAL: Stal', 1958, Nr 10, pp 920 - 922 (USSR)

ABSTRACT: The influence of micro-relief of the surface of strip,
small differences in the thickness of simultaneous coated
strips, the temperature of tin and speed of strip on the
thickness of tin coating was investigated. It was found
that the micro-relief of the surface undergoing tinning
has an influence on the thickness of coating. With
deterioration of the state of the surface, the consumption
of tin increases. With an improvement of the degree of
cleanliness of the surface from the 7th to the 10th class
(GOST 2789-51) the thickness of coating, under other
conditions constant, decreases by 6-10%. When tinning
simultaneously a few strips with a maximum permissible
difference in their thickness (0.03-0.04 mm) and other
conditions constant, the thickness of the coating on
thinner strips increases approximately by 10%. Tinning
at an increased temperature of the tin to 320-330 °C
(instead of the usual temperatures of 280-300 °C) and

Card1/2

SOV/133-58-10-17/31

A Decrease in the Thickness of Coating During Hot Tinning of Black Sheets

other conditions constant, permits decreasing the coating thickness by 8-9%. The advisability of the decrease in the tin consumption for coating by utilising higher temperature should be checked with regard to the overall tin consumption. With increasing velocity of passage of strip through the tinning bath, the thickness of coating increases. With velocity increasing from 2.2 to 4.45 m/min, the thickness of tin coating increases by 40%. There are 3 figures and 1 table.

PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 9, pp 1162-1164 (USSR)

ABSTRACT: In the present paper some cases of ultrasound detection of defects
in metal control are described. With respect to the ultrasonic
control of slabs it is mentioned that at present the zone of de-
fects caused by shrinkage are detected by means of the ultrasonic
fault detector UZD-12. The surface of the slabs is pretreated prior
to this determination. The defects of slabs caused by shrinkage
look like laminations and are found by the occurrence of an ad-
ditional impulse on the screen of the Braun tube. The diagram of
a holder for the ultrasonic pickup for the control of rollers is
given. It is mentioned, among other facts, that for the type of
control described the fault detector UZD-7N with depth gauge as
produced by the industry is suited. On the other hand the use of
the portable fault detector UZD-NIIM-3, devised by the Leningrad-
skiy nauchno-issledovatel'skiy institut mostov (Leningrad Scien-

Card 1/2

The Use of Ultrasound in the Detection of Defects
at the "Zaporozhstal'" Works

TITLE: On buckling of a cylindrical shell under a longitudinal impact

SOURCE: Prykladna mehanika, v. 10, no. 6, 1964, 632-639

TOPIC TAGS: elastic buckling, shell buckling, cylindrical shell buckling, axisymmetrical buckling, axial cylindrical shell impact, longitudinal hollow cylinder impact, impact loading

ABSTRACT: The buckling behavior of a cylindrical shell fixed at one end and subjected to an axisymmetric longitudinal impact on the free-end face by a rigid body moving at a certain speed is discussed in a linear geometric formulation. It is assumed that the shell does not have any initial shape irregularities, and the stresses do not exceed the elasticity limit. The axial displacements and force are determined from the known differential wave equation with initial and boundary conditions describing the membrane state of stress of the shell. V. V. Bolotin's "equations in variations" which describe the stress-

Card 1/2

L 16042-65

ACCESSION NR: AP5000108

strain relations in the part of the shell adjacent to the impacted end are used for investigating shell buckling. These equations are reduced, by using Galerkin's method, to a system of ordinary differential equations whose solution by Lyapunov's second method is indicated. The rates and regions of propagation of longitudinal and lateral stress waves are briefly discussed. A sample analysis is presented of axisymmetrical buckling of a simply supported cylindrical shell under impact by a body having an infinitely large mass. Orig. art. has: 25 formulas.

ABSTRACT: The axisymmetric dynamic buckling of a hinged cantilever cylindrical shell under a longitudinal axisymmetric impact by a rigid body is investigated, using the refined wave equations (accounting for shear strains and inertia of rotation) derived from nonlinear equations of the theory of elasticity. In deriving these equations a method is applied which is analogous to that used by S. P. Timoshenko in impact analysis of a beam. The results of this investigation are compared with those obtained by means of the classical theory of shells. The equation of motion of the shell shortly after impact (when the shell undergoes only the longitudinal vibrations described by a wave equation for a beam) is accepted as the equation of unperturbed motion. To derive the equations of perturbed motion of the shell, the general equations of elasticity theory are used as the initial equations, then re-

Cord 1/2

written in cylindrical coordinates for the case of axisymmetric deformation, from which, after transformation and reduction of the three-dimensional problem to the plane problem, a system of three second-order differential equations in nondimensional form is obtained which describes the perturbed motion of the shell. Thus, the whole problem is reduced to investigating the stability of these equations under certain initial and boundary conditions. The system is solved for a particular case when the mass of the impacting body is large as compared with that of the shell. The stability of this solution is discussed by comparing (in a diagram) the stability condition based on the Hurwitz theorem with that obtained from classical equations of shell theory. The estimation of the stability of the shell under the impact of a body of finite mass is outlined. Orig. art. has: 1 figure and 13 formulas.

AUTHOR: Borisenko, V. I. (Kiev)

TITLE: Effect of boundary conditions on the stability of a cylindrical shell under longitudinal impact

SOURCE: Prikladnaya mekhanika, v. 1, no. 8, 1965, 57-62

TOPIC TAGS: cylindrical shell, longitudinal shell impact, shell buckling, shell stability, shell impact buckling, shell dynamic stability

ABSTRACT: The dynamic-stability problem of a cylindrical shell fixed at one end and subjected to longitudinal impact by a rigid body at the other end is analyzed. The body moves at a given velocity in the axial direction of the shell; its mass is much larger than that of the shell. The shell buckles in the portion of the shell (called critical length) near adjacent to the impacted end after the longitudinal compression wave propagates in this portion, leaving the rest of the length of the shell in a relatively unperturbed state. The perturbed state is understood to mean shell vibrations in which small transverse perturbations induce transverse vibrations with increasing amplitude; the appearance of such vibrations is called buckling (loss of stability). The effect of stiffening of the impacted end on the magnitude of the

Card 1/3

L 65030-65

ACCESSION NR: AP5022215

buckling (critical) impact load, which depends on the mass and velocity of the impacting body, is analyzed, using the previously derived (by the author) equations of the perturbed motion of the shell. The boundary conditions on the impacted end and the conditions of the kinematic and dynamic compatibility between perturbed and unperturbed portions of the shell are discussed and established. After substitution of displacement components in the form of trigonometric series containing unknown time functions and functions satisfying the boundary and compatibility conditions into the initial equations with subsequent integration by the Galerkin method, a system of regular differential equations in terms of the time functions is obtained. By analyzing the roots of the characteristic equation of this system, the stability conditions of its solution are established from which an expression (in the form of an inequality) is obtained for determining the buckling (critical) impact load in terms of coefficients of the above system of equations. Four numerical calculations were performed for cylindrical shells with the following boundary conditions at the impacted end: hinged support, rigid clamping, free end, and hinged support with all the boundary and compatibility conditions taken into account. The relation between the critical load and nondimensional critical length ℓ_{cr}/R (R is the radius of the middle surface of the shell) is shown in a diagram. The results obtained end the

SOURCE: AN UkrRSR. Dopovidi, no. 7, 1966, 875-878

TOPIC TAGS: shell theory, shell deformation, cylindric shell structure, motion equation, compression shock wave, ordinary differential equation, SHELL STRUCTURE STABILITY, IMPACT STRESS

ABSTRACT: The author presents a method for studying the stability of a cylindrical shell under longitudinal impact. The basic differential equations of motion for the internal surface of a shell subjected to a longitudinal impact load at the edge are taken from the literature. It is assumed that the shell does not lose stability along its entire length but only at the point where the longitudinal compression wave is propagated. A variational expression is given which describes the vibrations of this region of the shell. It is assumed that these variations deviate from zero only where the longitudinal compression wave is propagated. The contact area between this disturbed section and the nondisturbed sections of the shell is considered. The author uses the Galerkin method for reducing the variational expression to a

TITLE: Postcritical deformation of a cylindrical shell under impact

SOURCE: Prikladnaya mekhanika, v. 2, no. 10, 1966, 29-35

TOPIC TAGS: cylindric shell, shell deformation, shell impact, elastic deformation, elastic impact deformation

ABSTRACT: The axisymmetrical elastic deformation of a circular cylindrical shell under longitudinal impact^{1/2} is investigated by using a system of nonlinear equations with the propagation of elastic stress waves taken into account, and without any assumptions concerning the mode of buckling. One end of the shell is fixed, the other end is axially impacted by a rigid solid moving at a velocity V; the ratio m of the mass of the body to the mass of the shell is given. The analysis of the impact-deformation process in this shell is reduced to solving this nonlinear system with initial and boundary conditions by the method of finite differences, utilizing an explicit scheme whose convergence and stability was checked. The behavior of the shell was studied in

Card 1/2

L 07443-67

ACC NR: AP6035492

the time interval in which the longitudinal compression wave propagates along the whole length of the shell, and the first reflected wave comes back. The results from calculating the normal displacements along the shell at various instants of both waves propagating, for the ratio $m = 3.64$ and nondimensional velocities $V/a = 0.0005; 0.001; 0.002;$ and 0.004 (where a is the velocity of sound) are shown in diagrams and are examined. The qualitative aspect of the shell deformation, especially the formation of maximum local displacements during the passage of both the compression and the reflected waves as related to V is discussed and found to be in agreement with the A. Koppa phenomenological theory based on experimental results. Orig. art. has: 5 figures and 13 formulas.

TITLE: Structural characteristics of fields of outgoing radiation according to data of the artificial satellites Tiros II and Tiros III and their interpretation

SOURCE: Kosmicheskiye issledovaniya, v. 3, no. 3, 1965, 433-443

TOPIC TAGS: radiation field, structural function, satellite, shortwave radiation, correlation function, upwelling radiation

ABSTRACT: The structure of the radiation field leaving the earth's atmosphere was studied on the basis of radiation data catalogs of the satellites Tiros II and Tiros III, which characterize the winter and summer radiation fields. A special coefficient was introduced for comparing the radiation measured by the two satellites. Structural functions of integral radiation obtained from measurements made by the two satellites differ from one another, and the difference increases with distance. The shortwave radiation measured by these satellites depended upon the reflectivity of the clouds and ground of the regions over which they flew. Structural functions of radiation fields obtained from satellite measurements also differ. It is more

Card 1/2

L 53987-65

ACCESSION NR: AP5015671

convenient to use correlation functions and compute the spectral density since it is independent of the filter transmission. The analysis of data obtained by Tiros III led to the conclusion that the radiation field is isotropic in a space extending 1000—2000 km. Reliable results about upwelling radiation may be obtained by performing measurements at points close to each other. Orig. art. has: 2 tables, 2 figures, and 11 formulas.

AUTHOR: Borisenkov, Ye. P.; Doronin, Yu. P.; Kondrat'yev, K. Ya.TITLE: Structural characteristics of the earth's radiation field
as a planet

SOURCE: Kosmicheskiye issledovaniya, v. 1, no. 1, 1963, 113-125

TOPIC TAGS: Tiros II, outgoing radiation, radiation field, weather
satellite, isotropy, atmospheric absorption band, atmospheric
window, terrestrial thermal radiation

ABSTRACT: A statistical investigation has been made with the Ural-2 computer of the fields of outgoing radiation (earth's surface to atmospheric system) based on data obtained on channels 1, 2, and 4 of Tiros II and later presented in the Tiros II Radiation Data Catalogue (1961). The mean and most probable values of the structural and correlation functions for each of the 52 orbits are presented. The isotropy of these functions was found to be

Card 1/2

L 17162-63

ACCESSION NR: AP3007339

best achieved for integral radiation and most poorly for radiation in the absorption band of water vapor. The change in structural functions is seen to occur rapidly at the onset and then ceases to grow for all practical purposes. Correlations are made between the structural characteristics of the fields of integral outgoing radiation and outgoing radiation in the "atmospheric window" (8 to 12 μ), and between the radiation fields and the meteorological parameters of the atmosphere. Abstract : Two groups of heifers (the first group included 5 heads of the Red Tambovskaya and 7 heads of the Simental'skaya breed; the second group consisted of 5 heads of each respective breed), were raised on rations which were similar in nutrition value but different in composition. The animals in the first group received during the first year of their life: 850 kilograms of roughage, 2,300 kilograms of juicy fodder, and 550 kilograms of concentrates. The animals of the second group received accordingly: 545 kilograms, 580 kilograms and 855 kilograms. After the first calving

all animals were placed on regular rations. The animals of the first group grew faster in length, depth and size. The blood indicators (erythrocytes and hemoglobin) of these animals as well as their metabolism and milk production were higher than in animals of the second group. It is recommended that the adult as well as the young stock of dairy farms be supplied with rations containing a larger amount of roughage and juicy fodder.

Orig Pub.	: Izv. Timiryazevsk. s.-kh. akad., 1957, No 6, 147-160.
Abstract	: The tremendous successes attained by zootechnology in elaborating the theory and praxis of breeding farm animals and the great achievements in increasing the productivity of socialist animal husbandry are discussed. A network of scientific-research institutes, experiment stations and laboratories has developed. A great deal of work was performed in studying local breeds and bantlings, and the basic foci in the origin of domestic animals. The impor-

 Abstract : tance of state breeding records, of animal breeding sovkhozes, of distribution centers, and of kolkhoz farms has increased. The theory of breeds, their perfection, linear breeding, methods of originating new breeds was developed. The constitution of farm animals, the histological structure of organs and tissues, the hematological indicators of various breeds and age groups, growth and development and the various factors affecting them were studied. A great deal of effort was devoted to studying

Abstract : and increasing vitality, fertility and productivity of farm animals. Effective breeding methods were developed and perfected. A complex evaluation of pedigreed animals and an evaluation based on progeny were applied, as well as correct matching under proper feeding and keeping conditions. Many new breeds of various species were raised. The methods of research work were perfected and were made more exact.

ABSTRACT : An outline of achievements and development of the theory and practice of the breeding of farm animals in the Soviet Union is given. The organization of a vast network of zootechnical scientific research institutes, experiment stations, and laboratories provided favorable conditions for the development of animal husbandry. State breeding centers and plemkhozes [breeding farms] were organized and herd books were established.

Title : The Methods of Breeding Farm Animals and
Their Place in the Work of Breeding Pedigreed

Orig Pub : Izv. Timiryazevsk. s.-kh. akad., 1958,
No 1, 169-174

Abstract : The article deals with the elements of the work of breeding, with basic methods of breeding (inbred or purebred, crossed and hybridized) and with their evaluation. Data are given which were obtained during a number of years at USSR kolkhozes and in foreign countries on the increase of live weight, milk

Title : The Importance of Inbreeding and Crossbreeding for the Improvement of Farm Animals

Orig Pub : Vestn. s.-kh. nauki, 1958, No 4, 72-76

Abstract : The author is of the opinion that inbreeding represents the basic method in breeding of farm animals. As the conditions of feeding, caring and keeping are improved, as the breed is separated by groups according to leading lines and as selection and choice are widely utilized, it is possible to improve and to perfect the breed in a needed direction by

means of inbreeding. The effectiveness of this method is illustrated by practical examples. Crossing may become a means for rapidly improving already existing breeds (absorbed and introduced crossing), and for creating mixed herds with increased productivity (inter-breed and variable crossing). The unreasonableness of becoming too much involved with crossing is stressed as it occurred in the case of one Kherson oblast' where the Red Steppe breed is crossed with 5 other breeds with the main objective of raising the milk's fat content. It is pointed out that the success of crossing presumes the existence of attested herds of purebred animals and there-
